

# Synthetic Paper - Research Question

Research question: Does a fixed seed make a toy evaluation repeatable?

Method: Run the same deterministic program twice with seed 7.

Sample: Four synthetic observations; no human or patient data.

# Synthetic Paper - Results

Results: Both runs report accuracy 0.75.

Table 1: Evaluation metrics

| Metric   | Baseline | Candidate |
|----------|----------|-----------|
| Accuracy | 0.750    | 0.875     |

Figure 1: The candidate metric is higher than the baseline.

## Synthetic Paper - Limitations

Limitations: The fixture does not establish performance outside toy data.

Reproducibility: code, data, and seed are recorded in the fixture manifest.
